

Fonts

Release 1.2 of the dc-fonts: Improvements to the European letters and first release of text companion symbols

Jörg Knappen

Abstract

I describe the improvements made to the dc fonts in release 1.2, and the text companion font added. The ec fonts will finally replace the present 128-character cm fonts as the default fonts of L^AT_EX.

1 Introduction

In 1990 at the TUG meeting in Cork, Ireland, the European T_EX user groups agreed on a 256-character encoding supporting many European languages with latin writing. This encoding is both an *internal encoding* for T_EX and a *font encoding*. This double nature is a consequence of the fact that both kind of encodings cannot be entirely separated within T_EX.

The design goals of the Cork encoding are to allow as many languages as possible to be hyphenated correctly and to guarantee correct kerning for those languages. Therefore it includes many ready-made accented letters.

It also includes some innovative features which have not become very popular yet, though they deserve to become so. The first to mention is a special, zero-width invisible character, the compound word mark (cwm). The second is the separation of the two characters <hyphen> and <hyphenchar>. By appropriate design of the hyphenchar glyph, hanging hyphenation can be achieved.

The final version of the Cork encoded fonts will be called ec (European Computer Modern or Extended Computer Modern) fonts. The current version, called dc fonts, is an intermediate step towards the final version. Note that in the case of bug fixes and improvements, the metrics may change.

The need for a text companion font was first articulated in the discussion of new 256 character mathematical fonts in 1993. In order to achieve a better orthogonality between text and math, some text symbols stored in the math fonts should be moved to the text companion fonts¹. The text companion fonts are also the ideal place to store some new characters, like currency symbols.

¹ The archives of the math-font-discuss mailing list are available for ftp on <ftp.cogs.susx.ac.uk> in directory `pub/tex/mathfont`.

2 Supported Languages

The following languages are supported by the Cork encoding: Afrikaans, Albanian, Breton, Croatian, Czech, Danish, Dutch, English, Estonian, Faroese, Finnish, French, Frisian, Gaelic, Galician, German, Greenlandic, Hungarian, Icelandic, Irish (modern orthography), Italian, Letzeburgish, Lusatian (Sorbian), Norwegian, Polish, Portuguese, Rhaetian (Rumantsch), Rumanian, Slovak, Slovene, Spanish, Swedish, Turkish. Many non-European languages using the standard latin alphabet (e.g., Bahasa Indonesia, Suaheli) are also supported.

In Europe, the following languages aren't supported: Azeri, Basque, Catalan, Esperanto, Irish (old orthography), Latvian, Lithuanian, Maltese, Sami, Welsh. Of course, Greek and all languages with cyrillic writing are outside the scope of the Cork encoding.

3 Improvements to the dc Fonts

3.1 Accents

In good typography, the accent marks should look different for capitals and lowercase letters respectively. The accent over a capital should be of a 'flat' design, while the accent on a lowercase letter should be 'steep'. The Computer Modern fonts by D. E. Knuth only have steep accents, suitable for lowercase letters.

Fig. 1: Letters with acute accent in the cmr font

There are no pre-accented letters provided, which leads to problems with proper hyphenation and kerning. However, the floating accent approach guarantees the consistency of all accented letters.

With the (now out-of-date) version 1.1 of the dc fonts, the situation is different. We have predesigned accented letters for all languages included in the ISO standards 8859-1 and 8859-2. If an 'exotic' accented letter is needed, it does not fit with the provided ones.

Fig. 2: Letters with acute accent in the dcr font (v1.1)

Note that the floating acute accent is the same for capitals and lowers, but different from both, being even steeper than the lowercase one.

With version 1.2 of the dc fonts, all inconsistencies have gone. The accents are different between capitals and lowers as they should be, and floating accents can be applied in a consistent manner.

óǎ Óǎ

Fig. 3: Letters with acute accent in the dcr font (v1.2)

Since the Cork encoding provides only one slot for each accent, the capital acute accent is taken from the *text companion* font tcr. This is possible because T_EX allows cross-font accenting.

The acute accent and the readily accented letters were taken with kind permission of the authors from the polish pl fonts, which provide the highest available quality for these shapes. The hungarian double acute accent and the grave accent follow the design of the acute accent.

3.2 Quotation marks

The design of quotation marks provides another challenge for the ec fonts. In the Computer Modern fonts, they are optimised to english usage.

“ ”

Fig. 4: Quotation marks in the cmr font

They lie asymmetrically in their boxen, which makes a wider space before and after a quotation. However, this kind of design produces a disaster, if the same english opening quotation mark is used as a german or polish closing quotation mark. Currently, macros have to compensate for this.

In the dc fonts 1.2, the quotation marks lie symmetrically in a tighter box, and the additional space is created by kerning against the `boundarychar`.

“ ”

Fig. 5: Quotation marks in the dcr font (v1.2)

The `boundarychar` feature was introduced with T_EX3 and METAFONT2; it is reasonable to assume that nowadays every T_EX user has access to these or later versions².

3.3 Miscellaneous

The shapes for polish letters are now taken from the polish pl font, leading to improved shapes on the ogoneked letters and the crossed l.

ą ę ł Ą Ę Ł

Fig. 6: Polish special letters in the dcr font (v1.2)

With the help of the czechoslovak T_EX users' group, the shapes of czech and slovak special letter have been improved, too.

ď ě ě ě Ď Ě Ľ Ě

Fig. 7: Some czech and slovak special letters in the dcr font (1.2)

The height of umlaut dots has been adjusted to the value contributed by the czechoslovak group (ä occurs in slovak); the value used in version 1.1 of the dc fonts was considered too low even by german users.

ä ä ä

Fig. 8: The letter ä in cmr, dcr v1.1, and dcr v1.2

The `hyphenchar` is now designed to hang out of its bounding box, thus allowing for hanging hyphenation.

☐ ☐

Fig. 9: Hyphen and hyphenchar with their bounding box

The release of version 1.2 also contains a new shape, a classical serif italic font. It was already prepared for version 1.1, but no parameter and driver files were present for it. It is an italic with upper serifs instead of ingoing hooks. This paragraph is typeset using the dccf font to show its appearance.

4 The tc Fonts

4.1 A text symbol encoding

Over the years, many reasons have accumulated for a new text symbol encoding. There are some text symbols currently stashed in the math fonts, the footnote marks, and the bullet (•) are among them.

* § ¶ † ‡ ||

Fig. 10: Footnote symbols from the cm math fonts

In 256-character math fonts they should not be preserved, but moved to a text symbol encoding.

* § ¶ ¶ † ‡ ||

Fig. 11: Footnote symbols from the tcr font

I have added serifs to the paragraph sign (¶) in the serif typefaces, and I have added another one having only one vertical stroke. The design of the section sign (§) was improved significantly, as can be seen from the boldface glyphs.

§ §

Fig. 12: Old and new design of the section mark

ISO standards 8859-1 (Latin 1), 8859-2 (Latin 2), and 6937 contain several custom signs. It will be easier to typeset text encoded according to those standards if the necessary symbols were easily accessible through a text symbol font.

² Maybe it was not a reasonable assumption in 1990, when the Cork encoding was born and the above mentioned versions were brand new.

Fig. 13: Currency signs from the tcr font

Finally, I wanted to have different style accents for capitals and lowercase letters. Since the Cork encoding does not have space for another fourteen accent glyphs, I decided to have the lowercase accents, which are needed far more often, in the dc fonts, and to put the capital accents into the text companion fonts.

The users of commercial fonts also want to access all glyphs stored in those fonts. Since most of those glyphs are textual, they all should be included into a text symbol font encoding.

4.2 The font encodings TS1 and TSA

For mainly technical reasons, I think the candidates for a text symbol encoding should be distributed over two fonts, their encoding named TS1 and TSA respectively. There are important differences between the technologies supported by METAFONT and T_EX compared to the path most commercial font suppliers choose.

The Computer Modern family of fonts supports the notion of a designsize, i.e., there are subtle differences between the shapes at different point sizes as illustrated in the next section. T_EX is able to raise and lower letters, thus it does not need an already raised digit to produce a superscript. It can also produce nice fractions using a macro from the T_EXbook, exercise 11.6, as $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{6}$.

Most commercial vendors took the easier path; their fonts come in only one size and are scaled up and down to other sizes. Thus, a small superscript does not look right, and to compensate for this a pre-designed superscript is added to the fonts. A subscript, too, because earlier text processors weren't able to raise or lower letters. For similar reasons, fraction glyphs were provided, or fraction were constructed out of a sequence $\langle \text{superscript digit} \rangle \langle \text{fraction} \rangle \langle \text{subscript digit} \rangle$, where fraction is a special slash to construct fractions.

On the other hand, it is almost impossible to follow this path with T_EX and METAFONT: The size of the superscripts can be influenced by T_EX macros, and therefore there is no unique 'virtual designsize' for ready-made superscripts.

The selection of superscripts offered by commercial vendors is at the moment rather sparse; many often needed ones are lacking.

2^{ième} 5th M^c

Fig. 14: Some superscript letters lacking in expert fonts

Therefore the rule of thumb for the distribution of glyphs is the following: Put all glyphs which can be conveniently made with METAFONT and are needed with T_EX into the encoding TS1, and put the remaining glyphs, mainly superscripts and subscripts, into the encoding TSA. There are some duplications and deviations from this rule of thumb, e.g., superscript 1, 2, and 3 are part of ISO 8859-1, thus they occur in TS1 as well as in TSA.

5 Standard Control Sequences

The following standard control sequences are assigned with L^AT_EX's T1 encoding for the dc fonts:

```
\r Ring accent (\r u gives ù)
\k Ogonek (\k e gives ę)
\dh, \DH Icelandic letter edh (ð, Ð)
\dj, \DJ Letter d with stroke (đ, Đ)
\ng, \NG Letter eng (ŋ, Ŋ)
\th, \TH Icelandic letter thorn (þ, Þ).
```

The package `textcomp` by Sebastian Rahtz assigns standard names to all text companion symbols. The documentation prints a nice table.

6 Ligatures

In the proportional fonts, the following ligatures are implemented:

```
-- - (en dash)
--- — (em dash)
‘ ‘ (english opening quotes,
   ’ ’ (english and polish closing quotes)
‚ ‚ (german and polish opening quotes)
<< << (french opening quotes)
>> >> (french closing quotes)
!‘ !‘ (spanish opening exclamation mark)
?‘ ?‘ (spanish opening question mark)
fi fi
ff ff
fl fl
ffi ffi
ffl ffl
```

There is another important ligature, not shown above:

$\langle \text{hyphen} \rangle \langle \text{hyphenchar} \rangle$ gives $\langle \text{hyphenchar} \rangle$. This allows the implementation of new hyphenation patterns with `hyphenchar '127` allowing hyphenation of words containing explicit hyphens. This ligature was missing by accident in the September

1995 release of `dc` 1.2, but has been added in patch-level 1 released in December 1995.

7 New Names of the Font Files

Currently, the extended Computer Modern fonts have the prefix `dc`. This prefix will change to `ec` with the final release after another round of bug fixing. I hope to make the transition from `dc` to `ec` in about one year. The text companion fonts have the prefix `tc`, which is not subject to change. However, later releases may include more characters and therefore have different checksums. No characters shall be removed from the `tc` fonts.

Most of the `dc` fonts can be generated at any size one wants in the range from 5pt to 100pt. For each size, a unique name is needed.

With release 1.2 of the `dc` fonts, a new, more precise naming scheme is in effect. Since there are widely used operating systems limiting the file name to 8 characters (plus an extension of 3 characters), the following scheme is used:

- The first two letters (either `dc` or `tc`) denote the encoding and the general design of the font.
- The following one or two letters denote the family, shape, and series attributes of the font, e.g., `r` for roman, `bx` for bold extended, `it` for italic, or `bi` for bold extended italic. A complete overview is given at the end of this section.
- The following four digits give the design size in $\text{T}_{\text{E}}\text{X}$'s points multiplied by 100, e.g., 1000 denotes ten point, 1440 denotes magstep 2, i.e., 14.4 point, and 0500 denotes five point.

Here are the implemented styles:

Roman family: `r` roman, `b` bold, `bx` bold extended, `sl` slanted, `bl` bold extended slanted, `cc` caps and small caps, `ti` (text) italic, `bi` bold extended italic, `u` unslanted italic, `ci` classical serif italic (new design).

Sans serif family: `ss` sans serif, `si` sans serif inclined (slanted), `sx` sans serif bold extended, `so` sans serif bold extended oblique (slanted).

Typewriter family: `tt` typewriter, `tc` typewriter caps and small caps, `st` slanted typewriter, `it` italic typewriter, `vt` variable width typewriter.

Various other fonts: `bm` variant bold roman, `dh` dunhill, `fb` Fibonacci parameters, `ff` funny, `fi` funny italic.

Here are some examples:

<code>dcr1000</code>	European Computer Modern roman at 10pt
<code>tcr1000</code>	Text companion symbols roman at 10pt
<code>dcss1728</code>	European Computer Modern sans serif at 17.28pt
<code>dcbx0900</code>	European Computer Modern roman bold extended at 9pt

Some remaining fonts come at one size only; those are:

<code>dcssdc10</code>	sans serif demi-bold condensed
<code>dcseq8</code>	sans serif quotation
<code>dcqi8</code>	sans serif quotation inclined
<code>dclq8</code>	latex sans serif quotation
<code>dcli8</code>	latex sans serif quotation inclined
<code>idclq8</code>	invisible latex sans serif quotation
<code>idcli8</code>	invisible latex sans serif quotation inclined.

The last four fonts are for the `slides` document class, which replaces old `SLI $\text{T}_{\text{E}}\text{X}$` . They contain a special version of the capital letter 'I'.

8 Upgrading to `ec`

Here is the following non-official schedule for the upgrade from the `dc` to `ec` fonts: One intermediate release (1.3) shall come out in spring 1996; the final release of the `ec` fonts shall be made in autumn 1996. Afterwards, the fonts will be frozen and only necessary bug fixes will be applied.

A The Cork Encoding

position description
(octal)

Accents for lowercase letters

000	grave
001	acute
002	circumflex
003	tilde
004	umlaut
